

## Recent pattern of low blood glucose levels, not low currently

If your child has experienced hypoglycaemia in the recent past, and you would like to know more about hypo management, and your child is not experiencing hypoglycaemia currently:

1. This is not an emergency
2. Call during office hours or send us an email to schedule a consult with one of our team members

### **Some examples include:**

- Morning lows or nocturnal lows
  - This is not an emergency; your child's blood glucose pattern will need to be analysed and the causative dose may need to be modified.
- Random lows
  - We would need to review your child's full blood glucose profile (during office hours), and you would need to schedule a diabetes medication dose adjustment task during office hours, during which we will also discuss hypoglycaemia with you and your child
- Persistent lows, but not dangerous
  - A day or even 2 of recurrent difficult to treat hypoglycaemia (all readings remain below 4mmol/L or briefly recover after every attempted treatment but fall below 4mmol/L again)
  - You will need to set up an appointment during office hours
